Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 36.911; Variance 63.964; scale 0.577

IT CAN EITHER ACTIVATE OR REPRESS TRANSCRIPTION DEPENDING OF E2RE'S POSITION WITH REGARDS TO PROXIMAL PROMOTER ELEMENTS. REPRESSION OCCURS BY STERICALLY HINDERING THE ASSEMBLY OF THE TRANSCRIPTION INITIATION COMPLEX. THE E1-E2 COMPLEX BINDS TO THE ORIGIN OF DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MCBRIDE A.A., BOLEN J.B., HOWLEY P.M.;

The MAP kinase-activated protein kinase 2 contains a proline-rich
The MAP kinase-activated protein kinase 2 contains a proline-rich
SH3-binding domain.";

EEBS LETT. 336:143-147(1993).

-!- FUNCTION: ITS PHYSIOLOGICAL SUBSTRATE SEEMS TO BE THE SMALL HEAT
SHOCK PROTEIN (HSPZT/H8225). IN VITRO CAN PHOSPHORYLARES GLYCOGEN
SYNTHASE AT SER-7 AND TYROSINE HEDROXYLASE (ON SER-19 AND SER-40).

THIS KINASE PHOSPHORYLATES SER IN THE PEPTIDE SEQUENCE, HYD-X-R-
X(2)-S., WHERE HYD IS A LARGE HYDROPHOBE RESIDUE (BY SIMILARITY).

THE FIRST INVOLVES THE STIMULATION OF P42/P44 MAPK BY GROWTH
CHARLY SHALLAND OF MRY2 AND UPSTREAM MAPKK/MAPKKK.

ON THE ACTIVATION OF MRY2 AND UPSTREAM MAPKK/MAPKKK.

-!- PTW: PHOSPHORYLATED BY MAP KIRASE.

-!- PTW: PHOSPHORYLATED BY MAP KIRASE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ä
-!- DOMAIN: EACH SUBUNIT IS COMPOSED OF THREE TRIPLE-HELICAL DOMAINS INTERSPERSED WITH NONCOLLAGENOUS DOMAINS. THE GLOBULAR DOMAIN AT THE N-TERMINUS OF TYPE IX COLLAGEN MOLECULES REPRESENTS THE NC4 DOMAIN WHICH MAY PARTICIPATE IN ELECTROSTRIC INTERACTIONS WITH POLYANIONIC GLYCOSAMINOGLYCANS IN CARTILAGE.
-!- PTM: PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING UNIT (G-X-Y) ARE HYDROXYLATED IN SOME OR ALL.OF THE CHAINS.
-!- SIMILARITY: THE COLLAGEN ALPHA 1(IX) CHAIN STRUCTURE DIFFERS FROM THAT OF THE POLYAPEPTIDE CHAINS OF FIBRILLAR COLLAGENS I - III; IT PIR, S02170; S02170.

Mean 25.973; Variance 96.013; scale 0.271 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Claim 19; Fig 3A; 82pp; English.

Human megakaryocyte kinase MKK3 (R84183) is a 58 kDa cytosolic tyrosine kinase showing 478 homology with fyn. Recombinant MKK3 cabe produced in host cells by expression of encoding cDNA (T00618), and used in the treatment-and-diagness-of-e-g:-leukaemia-and---
                                                                                                                                                                                                                                                                                                                                             56 flalydftarcggelsvrrgdrlcaleegggyifarrlsggpsaglvpithvak 109
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä

New protein tyrosine kinase genes and proteins encoded by genes -
are of human mega-karyocytic origin
Claim 3; Fig 5; 60pp; English.
PTR genes were identified using two sets of degenerative
Cligonucleotide primers: a first set which amplifies all pTK DNA
segments (049743-44), and a second set which amplifies highly
conserved sequences present in the catalytic domain of the c-kit
conserved sequences present in the pTK genes identified are described
in 049747-57 and R41897-02.
The LpTKs are expressed in lymphocytic cells, as well as
megakaryocytic cells. The partial and full-length LpTK2 gene
sequences are given in 049749 and 049754 respectively. The
protein sequence corresp. to 049749 is claimed (claim 7) and
stated as given in the specification, however is missing from
                                                                                                                        N-PSDB: T03097.

Agonist antibodies which activate specific protein tyrosine kinase(s) - also activate chimeric proteins of kinase extracellular domain and Ig constant domain, useful for studying, and therapeutic modulation of, cell growth and differentiation
Disclosure; Pages 56-58; 125pp, English.

DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. A LpTK2 gene (T03097) was isolated from lymphocytic and megakaryocytic cell libraries. The encoded novel pTK, LpTK2 (R85929), shows homology to known pTKs, and can be used to design drugs that modulate pTK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pTK gene LpTK.2 prod. prod. pTK; protein tyrosine kinase; catalytic domain; c-kit; megakaryocyte; lymphocyte; amplification; primer; polymerase chain reaction; PCR.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 1: Page 25; 70pp; English.

This sequence represents a D-form amino acid SH3 domain, synthesised as residues 81.140 of chicken c-SRC. This sequence was produced using the method of the invention. The method of the invention is for the production of a macromolecule (WM) of non-natural handedness (NNH), which binds to a target MM of natural handedness (NH). The method involves providing an enantiomer of the target MM (or its characteristic domain), and a library of MM's of NH. The library is contacted with the enantiomer under suitable conditions for the enantiomer to bind a member of the
                                                                                                                                                                                                                                                                     Genetically engineered endothelial cells - which exhibit enhanced cell migration, urokinase-type plasminogen activator activity, and reduced monounclear cell adhesion and fibronectin prodn Disclosure; Page 75-77; 91pp; English.

The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide (Given in Q46688) is used to transform endothelial cells. Transformed cells produce increased amounts of pp60 c-src and have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced monounclear cell adhesion. They can coronary angioplasty, heart bypass surgery, vessel graft and stent implantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14; Mismatches 19; Indels 2; Gaps

library, and the bound enantiomer is then produced. The method can also be used to produce L-Oligonucleotides (such as T44064) and D-amino acid peptide which binds to target L-MM's and for identifying an L-amino acid peptide which binds a D-amino acid peptide of interest. The method is used for identifying an L-amino acid peptide which binds a D-amino acid peptides, proteins.

Used for identifying MB's of NNH (such as peptides, proteins, protein-lipid complexes) which are ligands for other target MM's, e.g. DNA, hormones, and antibodies. The method is especially useful for identifying D-peptides and L-nucleic acids (from naturally occurring L-peptides and D-nucleic acids) for use as drugs. These compounds maybe superior drugs to the corresponding compounds of NH since they are not good substrates for naturally occurring proteases and nucleases and do not elicit an efficient immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell migration, unckinase-type plasminogen activator activity, and reduced mononuclear cell adhesion and fibronectin produ pisclosure; page 64-66; 91pp; Bnglish.

The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide (Given in Q46687) is used to transform endothelial ransformed cells produce increased amounts of pp60 c-src and have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced mononuclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22-JUN-1997 (first entry)
Human signal mediator protein encoded by HEF1 cDNA.
Signal mediator protein; SNP; human enhancer of filamentation;
HEF1; cell morphology; neoplasia; SH3; SH2; pseudohyphal budding;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genetically engineered endothelial cells - which exhibit enhanced

Tidentifying polypeptide(s) having specific functional domain (esp. 1813 domain) - comprises detecting selective binding to recognition but, regardless of sequence homology

For unit, regardless of sequence homology

For Claim 55, Fig 10a; 174pp; English.

W3420-W34253 represent Src-homology region 3 (SH3) domains from human can mouse proteins, that can be used in the method of the invention. This sequence represents as H3 domain of the mouse SH312 protein (see W65393) corp.

For full length protein). SH3 domain of the method of the invention signalling and structural elements of cells. The method of the invention is for identifying polypeptides containing functional domains of interest (especially SH3 domains). It comprises contacting a multivalent recomplex. The recognition unit (RU) complex with a number of peptides and identifying polypeptides having a selective binding affinity for the RU complex. The method is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for identifying proteins containing an SH3 domain due to the minimal sequence homology among known SH3 proteins. Multivalent RU complexes are particularly suited to screening for polypeptides containing functional domains that care similar to, but not identical in sequence to, the original target functional domain. The new method enables proteins having a common
                                                                                                                                                                                                                                                                                                                                                                                                        The human gene encoding this protein is closely related to but distinct from the abl proto-oncogene and is a member of the tyrosine kinase encoding family of genes. Arg is expressed as two transcripts. By analogy with c-abl, the alternative 5' arg sequences have been designated A (Q14936) and B and it is assumed that they are joined to the arg second exon.

The amino acid sequence is represented as found in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20-FEB-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The human gene encoding this protein is closely related to but distinct from the abl proto-oncogene and is a member of the tyrosine kinase encoding family of genes. Arg is expressed as two transcripts. By analogy with c-abl, the alternative 5' arg sequences have been designated A and B (Q14937) and it is assumed that they are joined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to the arg second exon.
The amino acid sequence is represented as found in the specification.

The mammalian signal mediator protein is involved in regulation of cellular morphological alterations. The encoded protein comprises an amino-terminal SH3 domain, an internal domain contg. several SH2 binding motifs, and a carboxy-terminal effector domain that can induce pseudohyphal budding in yeast. The DNA and related prods, are useful as research tools and as diagnostic and therapeutic agents for the identification, detection and regulation of complex signaling events leading to morphological, Sequence 834 AA;

Notice to the monomer Russ detective binding to recognition unit, regardless of sequence homology

Claim 54: Fig 65: 174pp; English.

Claim 54: Fig 65: 174pp; English.

Claim 54: Fig 65: 174pp; English.

Commain containing proteins that can be used in the method of the invention. SH3 domain containing proteins play a role in signalling and invention. SH3 domain containing proteins play a role in signalling and structural elements of cells. The method of the invention is for comparing functional domains of interest (especially SH3 domains). The method comprises contacting a multivalent recognition unit (RU) complex with a number of peptides and identifying polypeptides having a selective binding affinity for the RU complex. The method is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for identifying proteins which contain an SH3 domain due to the minimal sequence homology compared to monomer RUs. Multivalent RU complexes are particularly suited compared to monomer RUs. Multivalent RU complexes are particularly suited compared to monomer RUs. Multivalent RU complexes are particularly suited functional domain. The new method enables proteins having a common functional domain. The new method enables proteins having a common compared to be identified. Identification of novel SH3 proteins will be useful for a better understanding of cell growth, malignancy, signal cransduction processes, etc. New caldidate drugs can be assessed the neithod of the invention.
                                                                                                                                                                                                    ô
function to be identified. Identification of novel SH3 proteins will be useful for a better understanding of cell growth, malignancy, signal transduction processes, etc. New candidate drugs can be identified, and their specificities (e.g. pharmacological activities) can be assessed using the method of the invention.

The standard of sequence homology and the standard of secondition unit, regardless of sequence homology with the sequence homology with the sequence homology selective binding to recognition with the sequence homology region 3 (5H3) and 54; Fig 43; 174pp; English.

Claim 54; Fig 43; 174pp; English.

Claim 54; Fig 43; 174pp; English.

Compared to the inchement of the incention is the invention. SH3 domain containing proteins play a role in signalling and structural elements of cells. The method of the invention is for interest containing polypeptides containing functional domains of interest (especially SH3 domains). The method comprises contacting a multivalent component (CC recognition unit (RN) complex with a number of peptides and identifying polypeptides having a selective binding affinity for the RV complex. The method is based on functional similarities and does not rely on sequence compared is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for identifying proteins which contain an SH3 domain due to the minimal sequence homology among known SH3 proteins. It has been found that small peptide RUS in multivalent form have reduced specificity for a given functional domains that are common compared to monomer RUS. Multivalent RUS (morplexes are particularly suited to screening for polypeptides containing functional domains that are common contained for a better understanding of cell growth, malignancy, signal contains the method of the invention.

CLOSSING COMPART SPECIFICIALS (e.g. pharmacological activities) can be assessed that specificities (e.g. pharmacological activities) can be assessed that specific interpretains with the compared contains the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                               Mouse SH3P12 protein.

Claim 1: Page 4-5: 6pp: Japanese.
This sequence is the Lymphoid cell protein-tyrosine kinase (Lck) SH3
domain of the invention. The DNA and protein are useful as immune
suppressants, and are useful for inhibition and treatment of autoimmune
diseases caused by Lck analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure: Fig 4: 7pp; Japanese.

This sequence is encoded by a fragment of the vector pHFZprNeoDT. This sequence is encoded by a fragment of the vector with the passeste, containing the neo gene, MVM pause signal sequence, MC1 promoter, a diphtheria toxin A (DT-A) fragment and bluescript DNA. The neo gene has a PCK promoter just upstream of it, and the MVM pause signal and bluescript DNA are inserted between the neo gene and the MC1 promoter. This construct was used in the selection of a cell containing a genomic DNA gene which is deleted or reduced by homologous recombinantion with DT-A. The cassette is preferably expressed in embryonic stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunosuppressant DNA and protein – useful for inhibition and treatment of autoimmune diseases caused by lymphoid cell

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

BOSCH T.C.G., UNGER T.F., FISHER D.A., STEELE R.E.;

Structure and expression of STK, a src-related gene in the simple metazoan Hydra attenuata.";

MOL. CELL. BIOL. 9:4141-4151(1989).

-! CATALITIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE PROFENSINE PROSPHATE.

-! SIMILARITY: CONTAINS 1 SH2 DOMAIN.

-! SIMILARITY: TO OTHER PROFEIN-TYROSINE KINASES IN THE CATALITIC DOMAIN. BELONGS TO THE SRC SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        60 FRALYDFTARCAEELSVSRGDRLYALKEEGDYIFAQRLSGPPSTGLVPVTYLAK 113
